

Our project is called "**GigConnect**". It's an app designed to connect customers with independent contractors and gig workers in a seamless, efficient way. Here's how it works:

1. **User Accounts:** There are three types of users: admins, customers, and gig workers (independent contractors).
2. **Customer Side:**
 - Customers can create an account and log in.
 - Once logged in, they can select a category based on the type of problem they need assistance with (e.g., woodworking, plumbing, house painting, etc.).
 - Customers can describe their problem in detail, upload images, and post it within the relevant category. The post will be visible to contractors in that specific field.
 - When a contractor views the issue, they can respond by proposing a price to handle the job. Customers will be able to view these offers and decide whether to accept one.
 - Once a job is completed, customers can rate the contractor and leave a review based on their experience.
3. **Gig Worker/Contractor Side:**
 - Contractors can also create their own accounts and log in.
 - After logging in, they can browse through the list of posted problems in their field of expertise.
 - Contractors can call or propose a price for the jobs they are interested in.
 - They can negotiate with customers based on the offer and finalize the deal once the customer accepts the price.
4. **Interaction and Feedback:**
 - Communication between customers and contractors will be smooth, enabling price negotiations and updates.
 - Customer reviews and ratings will help contractors build their reputation, while customers can rely on ratings to choose the best workers for future tasks.

This project will serve as a bridge between customers with specific needs and skilled workers looking for job opportunities. It provides transparency, direct communication, and accountability on both sides.
